Washington, D. C.  
April 1960

## INTRODUCTION

A great part of the current literature on radiation is concerned only with ionizing radiation, often without this restriction being apparent in the title. It was felt, therefore, that a list of selected references on the biological effects of the various kinds of non-ionizing radiation would be useful, since the occult, relatively undramatic, and at the same time commonplace character of non-ionizing radiation contributes to its importance as a potential biological hazard.

The references were selected primarily from the Index-Catalogue of the Library of the Surgeon-General's Office, the Subject Catalog of the National Library of Medicine, 1950-1954, 1955, 1956, 1957, and 1958, the Current List of Medical Literature, 1950-1959, the Quarterly Cumulative Index Medicus, 1927-1956, Excerpta Medica, Section 2, Physiology, Biochemistry and Pharmacology, 1948-1959, Section 4, Medical Microbiology, Immunology and Serology, 1948-1959, Section 14, Radiology, 1947-1959, Section 16, Cancer, 1953-1959, Section 17, Public Health, Social Medicine and Hygiene, 1955-1959, document reports and indexes, and bibliographies in papers by specialists. The years covered were 1916 through 1959.
